

The 3D Wave: Spherical Aberration Testing Because You Can't Diagnose What You Can't See

In our office, we use the innovative 3-D Wave. This remarkable wavefront device uses the most advanced technologies available to help us better evaluate your unique vision needs. It gives us the ability to measure and diagnose your corneal spherical aberration much more thoroughly than has ever been possible before.

Using information from the 3-D Wave, we can make better recommendations to help you see more clearly. If you are considering cataract surgery, the 3D Wave will provide us with information to better match the implant to your eye. This allows us to achieve the best fit.

This high level of technology is above and beyond the standard level of care for cataract surgery in the United States and is not available in every practitioner's office. We are pleased to offer the best available care for our patients. Our job is to make your vision as close to perfect as we can, and the 3-D Wave helps us do the job.
